

Xi-Text

Enterprise Printer
Management for
UNIX and Linux
Systems

Printing is one of the most critical operational requirements of any large system installation. Xi-Text delivers the power, flexibility and scalability to handle the needs of any production printing environment.

A systems administrator at a multinational telecommunications company says, *"If we can't print our customer's bills, then we're not making money. We can't risk millions of dollars of revenue on a print system that can't handle our load."*

A systems manager of a printing services company reports, *"We print millions of pages every month of utility bills, invoices, bank statements and credit card statements. (Xi-Text) does exactly what it is supposed to do without any hassles."*

Both of these customers have realized the value of Xi-Text, a printing management system that operates seamlessly across multiple platforms, with a unified mode of operation and a centralized control point for all of their printing operations.

Xi-Text is proven technology, in use worldwide on hundreds of systems. A car rental company uses Xi-Text to manage report distribution to its foreign offices. A textiles manufacturer relies on Xi-Text to drive banks of report printers as well as its document imaging systems. A newspaper publishing group has selected Xi-Text as an embedded component of the software systems it supplies to its affiliated newspapers.

Xi-Text has the features that enterprise users require, without the price tag and complexity of other print and output management solutions. Xi-Text imposes no limitations on the number of printers and print jobs it can support, and offers advanced features such as automatic load balancing, transparent networking, an integrated viewer and full security control over printers, jobs and system users.

Taricon Technologies, Inc.
155 Springwood Drive
Springboro, Ohio 45066
